

Web-based Application Management

Cooperative solutions and intuitive tools are crucial for international projects when trying to deal with increasing levels of labour division among donors, implementing organizations and external service providers in an efficient manner.

The web-based application management tool enables all stakeholders to update data in real time. This creates a cooperative dynamic within the project and sustainably solves the problem of outdated data, duplication of work, information redundancies and unnecessary, time-consuming communication loops.

Benefits

- The **Management Cockpit** displays all relevant applications (pending, ongoing and completed)
- Automatically generated **tables** with a **traffic light function** show whether applications are being processed in a timely manner
- Application pages are linked with a **monitoring system**. This system generates overviews with **charts** summarizing the project's progress
- A uniform design of **application forms** increases comparability
- An overview tool highlighting outdated data sets optimizes data management
- **Links** to pages with more detailed information
- Interactive **overview maps** and **diagrams**
- Comprehensive **search and filter functions**
- A **country database** linked to the application management system creates pages with project-related country information
- A **PR and communication portal** hosts all relevant materials and publications
